COMPLIANCE WITH RULE 17.1(a) OR (b)

AUSTRALIA

Patents Act 1990

Provisional Specification

for an invention entitled:

AN APPARATUS (AP36)

The invention is described in the following statement: -

AN APPARATUS (AP36)

FIELD OF THE INVENTION

5 The following invention relates to a device having an in-built image sensor and an internal print engine. More particularly, the invention relates to a telescope having an internal printer.

Conventional telescopes include a lens or sequence of lenses and an eyepiece through which a person can view a remote object. It is known to attach a camera to a telescope in order to take a photograph of a remote object, but it might be desirable to
10 provide a telescope having an in-built image sensor and an in-built printer for printing a permanent record of the remote object as viewed.

Moreover, it would be beneficial for amateur astronomers, bird watchers, mariners and any other person wishing to use a telescope if a permanent printed record of what has been viewed could be made, instantaneously and inexpensively.

15

DISCLOSURE OF THE INVENTION

There is disclosed herein a telescope having a built-in printer for printing a graphic image of a remote object as received by the telescope.

Preferably the telescope includes an image sensor associated with a print engine
20 controller controls a print head.

Preferably associated with the image sensor and print engine controller is a micro-control circuit adapted to control a motor driver for print media transportation and a motor driver for operation of a guillotine motor for severing a printed image from a roller of print media.

25 Preferably associated with the print engine controller is an image memory.

Preferably the print head is a monolithic pagewidth print head.

Preferably the print head is an ink jet print head.

Preferably the printer includes a print engine assembly comprising first and second sub-assemblies, the first sub-assembly incorporating an ink source and print media and the
30 second sub-assembly incorporating a print head.

Preferably the telescope is portable and the printer is located within a longitudinal body of the telescope and said image sensor is located at or near one end of the printer, the telescope also including an eyepiece at or near another end of the printer and wherein the longitudinal body includes a slot through which a graphic image printed by the printer can be dispensed.

BRIEF DESCRIPTION OF THE DRAWINGS

The invention will now be described by way of example with reference to the accompanying diagrammatic drawings in which:-

Figure 1 shows a three dimensional view of a print engine, including components in accordance with the invention;

Figure 2 shows a three dimensional, exploded view of the print engine;

Figure 3 shows a three dimensional view of the print engine with a removable print cartridge used with the print engine removed;

Figure 4 shows a three dimensional, rear view of the print engine with the print cartridge shown in dotted lines;

Figure 5 shows a three dimensional, sectional view of the print engine;

Figure 6 shows a three dimensional, exploded view of a print head sub-assembly of the print engine;

Figure 7 shows a partly cutaway view of the print head sub-assembly;

Figure 8 shows a sectional end view of the print head sub-assembly with a capping mechanism in a capping position;

Figure 9 shows the print head sub-assembly with the capping mechanism in its uncapped position;

Figure 10 shows an exploded, three dimensional view of an air supply arrangement of the print engine;

Figure 11 is a schematic block diagram of components incorporated into a telescope having a built-in printer; and

Figure 12 is a schematic perspective view of a telescope having an in-built printer.

DESCRIPTION OF THE PREFERRED EMBODIMENT

In Figures 1 to 10 of the accompanying drawings, reference numeral 500 generally

designates a print engine, in accordance with the invention. The print engine 500 includes a print engine assembly 502 on which a print roll cartridge 504 is removably mountable.

The print cartridge 504 is described in greater detail in our co-pending applications entitled "A Print Cartridge" (docket number CA02) and "An Ink Cartridge" (docket number 5 CA04) filed as International Patent Application numbers PCT/AU00/00741 and PCT/AU00/00742 respectively, the contents of that disclosure being specifically incorporated herein by reference.

The print engine assembly 502 comprises a first sub-assembly 506 and a second, print head sub-assembly 508.

10 The sub-assembly 506 includes a chassis 510. The chassis 510 comprises a first molding 512 in which ink supply channels 514 are molded. The ink supply channels 514 supply inks from the print cartridge 504 to a print head 516 (Figures 5 to 7) of the print head sub-assembly 508. The print head 516 prints in four colors or three colors plus ink which is visible in the infra-red light spectrum only (hereinafter referred to as 'infra-red 15 ink'). Accordingly, four ink supply channels 514 are defined in the molding 512 together with an air supply channel 518. The air supply channel 518 supplies air to the print head 516 to inhibit the build up of foreign particles on a nozzle guard of the print head 516.

The chassis 510 further includes a cover molding 520. The cover molding 520 supports a pump 522 thereon. The pump 522 is a suction pump, which draws air through an 20 air filter in the print cartridge 504 via an air inlet pin 524 and an air inlet opening 526. Air is expelled through an outlet opening 528 into the air supply channel 518 of the chassis 510.

The chassis 510 further supports a first drive motor in the form of a stepper motor 530. The stepper motor 530 drives the pump 522 via a first gear train 532. The stepper motor 530 is also connected to a drive roller 534 (Figure 5) of a roller assembly 536 of the 25 print cartridge 504 via a second gear train 538. The gear train 538 engages an engageable element 540 (Figure 2) carried at an end of the drive roller 534. The stepper motor 530 thus controls the feed of print media 542 to the print head 516 of the sub-assembly 508 to enable an image to be printed on the print media 542 as it passes beneath the print head 516. It also to be noted that, as the stepper motor 530 is only operated to advance the print media 542, 30 the pump 522 is only operational to blow air over the print head 516 when printing takes place on the print media 542.

The molding 512 of the chassis 510 also supports a plurality of ink supply conduits in the form of pins 544 which are in communication with the ink supply channels 514. The

ink supply pins 544 are received through an elastomeric collar assembly 546 of the print cartridge 504 for drawing ink from ink chambers or reservoirs 548 (Figure 5) in the print cartridge 504 to be supplied to the print head 516.

5 A second motor 550, which is a DC motor, is supported on the cover molding 520 of the chassis 510 via clips 552. The motor 550 is provided to drive a separating means in the form of a cutter arm assembly 554 to part a piece of the print media 542, after an image has been printed thereon, from a remainder of the print media. The motor 550 carries a beveled gear 556 on an output shaft thereof. The beveled gear 556 meshes with a beveled gear 558 carried on a worm gear 560 of the cutter assembly 554. The worm gear 560 is
10 rotatably supported via bearings 562 in a chassis base plate 564 of the print head sub-assembly 508.

The cutter assembly 554 includes a cutter wheel 566, which is supported on a resiliently flexible arm 568 on a mounting block 570. The worm gear 560 passes through the mounting block 570 such that, when the worm gear 560 is rotated, the mounting block
15 570 and the cutter wheel 566 traverse the chassis base plate 564. The mounting block 570 bears against a lip 572 of the base plate 564 to inhibit rotation of the mounting block 570 relative to the worm gear 560. Further, to effect cutting of the print media 542, the cutter wheel 566 bears against an upper housing or cap portion 574 of the print head sub-assembly 508. This cap portion 574 is a metal portion. Hence, as the cutter wheel 566 traverses the
20 capped portion 574, a scissors-like cutting action is imparted to the print media to separate that part of the print media 542 on which the image has been printed.

The sub-assembly 506 includes an ejector mechanism 576. The ejector mechanism 576 is carried on the chassis 510 and has a collar 578 having clips 580, which clip and affix the ejector mechanism 576 to the chassis 510. The collar 578 supports an insert 582 of an
25 elastomeric material therein. The elastomeric insert 582 defines a plurality of openings 584. The openings 584 close off inlet openings of the pins 544 to inhibit the ingress of foreign particles into the pins 544 and, in so doing, into the channels 514 and the print head 516. In addition, the insert 584 defines a land or platform 586 which closes off an inlet opening of the air inlet pin 524 for the same purposes.

30 A coil spring 588 is arranged between the chassis 510 and the collar 578 to urge the collar 578 to a spaced position relative to the chassis 510 when the cartridge 504 is removed from the print engine 500, as shown in greater detail in Figure 3 of the drawings. The ejector mechanism 576 is shown in its retracted position in Figure 4 of the drawings.

The print head sub-assembly 508 includes, as described above, the base plate 564. A capping mechanism 590 is supported displaceably on the base plate 564 to be displaceable towards and away from the print head 516. The capping mechanism 590 includes an elongate rib 592 arranged on a carrier 593. The carrier is supported by a displacement mechanism 594, which displaces the rib 592 into abutment with the print head 516 when the print head 516 is inoperative. Conversely, when the print head 516 is operational, the displacement mechanism 594 is operable to retract the rib 592 out of abutment with the print head 516.

The print head sub-assembly 508 includes a print head support molding 596 on which the print head 516 is mounted. The molding 596, together with an insert 599 arranged in the molding 596, defines a passage 598 through which the print media 542 passes when an image is to be printed thereon. A groove 700 is defined in the molding 596 through which the capping mechanism 590 projects when the capping mechanism 590 is in its capping position.

An ink feed arrangement 702 is supported by the insert 599 beneath the cap portion 574. The ink feed arrangement 702 comprises a spine portion 704 and a casing 706 mounted on the spine portion 704. The spine portion 704 and the casing 706, between them, define ink feed galleries 708 which are in communication with the ink supply channels 514 in the chassis 510 for feeding ink via passages 710 (Figure 7) to the print head 516.

An air supply channel 711 (Figure 8) is defined in the spine portion 704, alongside the print head 516.

Electrical signals are provided to the print head 516 via a TAB film 712 which is held captive between the insert 599 and the ink feed arrangement 702.

The molding 596 includes an angled wing portion 714. A flexible printed circuit board (PCB) 716 is supported on and secured to the wing portion 714. The flex PCB 716 makes electrical contact with the TAB film 712 by being urged into engagement with the TAB film 712 via a rib 718 of the insert 599. The flex PCB 716 supports busbars 720 thereon. The busbars 720 provide power to the print head 516 and to the other powered components of the print engine 500. Further, a camera print engine control chip 721 is supported on the flex PCB 716 together with a QA chip (not shown) which authenticates that the cartridge 504 is compatible and compliant with the print engine 500. For this purpose, the PCB 716 includes contacts 723, which engage contacts 725 in the print cartridge 504.

As illustrated more clearly in Figure 7 of the drawings, the print head itself includes a nozzle guard 722 arranged on a silicon wafer 724. The ink is supplied to a nozzle array (not shown) of the print head 516 via an ink supply member 726. The ink supply member 726 communicates with outlets of the passages 710 of the ink feed arrangement 702 for feeding ink to the array of nozzles of the print head 516, on demand.

In Figure 10, the air supply path for supplying air to the print head 516 is shown in greater detail. As illustrated, the pump 522 includes an impeller 728 closed off by an end cap 730. The cover molding 520 of the chassis forms a receptacle 732 for the impeller 728. The cover molding 520 has the air inlet opening 734 and the air outlet opening 736. The air inlet opening 734 communicates with the pin 524. The air outlet opening 736 feeds air to the air supply channel 518 which, in Figure 10, is shown as a solid black line. The air fed from the air supply channel 518 is blown into the print head 516 to effect cleaning of the print head. The air drawn in via the pump 522 is filtered by an air filter 738, which is accommodated in the print cartridge 504. The air filter 738 has a filter element 740 which may be paper based or made of some other suitable filtering media. The filter element 740 is housed in a canister, having a base 742 and a lid 744. The lid 744 has an opening 746 defined therein. The opening 746 is closed off by a film 748 which is pierced by the pin 524. The advantage of having the air filter 738 in the print cartridge 504 is that the air filter 738 is replaced when the print cartridge 504 is replaced.

It is an advantage of the invention that an air pump 522 is driven by the stepper motor 530, which also controls feed of the print media to the print head 516. In so doing, fewer components are required for the print engine 500 rendering it more compact. In addition, as the same motor 530 is used for operating the air pump 522 and for feeding the print media 542 to the print head 516, fewer power consuming components are included in the print engine 500 rendering it more compact and cheaper to produce.

It is also to be noted that, in order to make the print engine 500 more compact, the size of the print engine assembly 502 is such that most of the components of the assembly 502 are received within a footprint of an end of the print cartridge 504.

In Figure 11 there is schematically depicted in block diagram form the key internal components of a telescope having an internal printer. The printer would typically utilize a monolithic print head 814 which could be the same as described above with reference to Figures 1 to 10, but could alternatively be another compact print head capable of printing on photograph-sized print media. An image sensor 806 receives images from a lens 802

(Figure 12) of the telescope. Image data from the image sensor 806 is fed to a print engine controller 813 which controls the print head 814. A memory 815 is associated with the print engine controller and stores an image memory. This image memory might be stored upon depression of a trigger 817 for example.

5 A micro-controller 807 associated with the image sensor and print engine controller controls a motor driver 809 which in turn drives a media transport device 810. This might be the same as stepper motor 530 described earlier.

10 The micro-controller 807 also controls a motor driver 811 which in turn controls a guillotine motor 812 to sever a printed sheet from an in-built roll of print media after an image is printed. A sheet being driven by media transport device 810 is shown in dotted lines at 816 in Figure 12. The guillotine might be of the form of cutter wheel 566 described earlier.

15 Figure 12 depicts a particular embodiment of a telescope incorporating an in-built printer. The telescope 800 includes a printer body portion 803 from which there extends telescopic lens components 802 and 805. Component 802 might rotate with respect to component 802 to effect an extension or retraction of the telescope for focusing on an object. An image sensor might be provided within portion 805 and might relay information electronically to the eyepiece 802 in which there might be provided an electronic display unit. That is, the printer might be located between the image sensor and the display unit.

20 The printer body portion 803 includes a slot 804 through which paper 816 having an image printed thereon can be dispensed. A trigger 817 can be positioned on the body portion 803 or any other part of the telescope to initiate a printing operation.

25 In use, a person holding the telescope 800 would use eyepiece 801 to view a remote object. When ready, the trigger 817 can be depressed to activate the print engine controller to print an image stored in memory 815. This would in turn activate the micro-controller 807 to activate the media transport 810 and guillotine 812. A printed image 816 having passed out of slot 804 would then be available as a permanent record.

30 While particular embodiments of this invention have been described, it will be evident to those skilled in the art that the present invention may be embodied in other specific forms without departing from the essential characteristics thereof. The present embodiments and examples are therefore to be considered in all respects as illustrative and not restrictive, the scope of the invention being indicated by the appended claims rather than the foregoing description, and all changes which come within the meaning and range

of equivalency of the claims are therefore intended to be embraced therein. It will further be understood that any reference herein to known prior art does not, unless the contrary indication appears, constitute an admission that such prior art is commonly known by those skilled in the art to which the invention relates.

CLAIMS:

1. A telescope having a built-in printer for printing a graphic image of a remote object as received by the telescope.
- 5 2. The telescope of claim 1 including an image sensor associated with a print engine controller which controls a print head.
3. The telescope of claim 2 wherein associated with the image sensor and print engine
10 controller is a micro-control circuit adapted to control a motor driver for print media transportation and a motor driver for operation of a guillotine motor for severing a printed image from a roller of print media.
4. The telescope of claim 2 wherein associated with the print engine controller is an
15 image memory.
5. The telescope of claim 2 wherein the print head is a monolithic pagewidth print head.
- 20 6. The telescope of claim 2 wherein the print head is an ink jet print head.
7. The telescope of claim 1 wherein the printer includes a print engine assembly comprising first and second sub-assemblies, the first sub-assembly incorporating an ink source and print media and the second sub-assembly incorporating a print head.
- 25 8. The telescope of claim 2 being a portable telescope and wherein the printer is located within a longitudinal body of the telescope and said image sensor is located at or near one end of the printer, the telescope also including an eyepiece at or near another end of the printer and wherein the longitudinal body includes a slot through which a graphic
30 image printed by the printer can be dispensed.

ABSTRACT

5 A telescope 800 includes a lens 802 and an eyepiece 801 by which a person can view a remote object. The telescope includes a built-in printer to provide an instantaneous permanent record of an image viewed by the person. Upon activation of a trigger 817, a permanent graphic image is printed onto a sheet 816 that passes out of the telescope via slot 804.
